Term Project

For the term project, you are going to develop a short lecture and a hands-on Matlab demonstration or exercise with explanatory written notes (a handout) that will cover an aspect of data analysis. You could cover a topic that we will cover in class or a new topic that is of interest to you. I would strongly suggest that your exercise involve a practical application of the technique to data that interests you.

The total time allotted to the lecture and demonstration will be 30 minutes (we will schedule them in finals week in a computer lab) and I would suggest dividing the time about equally between the lecture and demonstration.

I will discuss this early in the class and will meet with you all individually to discuss projects as the class progresses.

I would like to get copies of your handouts and demonstrations.
